PEG 2026 · ICLP / FLoC · Lisbon · 19 July 2026

Logical English — continued from this morning

- **The text is the program — no separate codification to keep faithful to the prose**
- Templates define the vocabulary; indentation gives and/or scope; semantics: logic programming
- Every answer — and every failure — is explained in the same English

the templates are:

a person acquires British citizenship on *a date*.
a person is born in *a place* on *a date*. ...

the knowledge base citizenship includes:

a person acquires British citizenship on a date
if the person is born in the UK on the date
and the date is after commencement
and an other person is the mother of the person
or the other person is the father of the person
and the other person is a British citizen on the date
or the other person is settled in the UK on the date.

LE1 → LE2: consolidation, not extension

LE1 — research breadth (Imperial College & partners)

- SWISH package · 3 back-ends: Prolog, TaxLog, s(CASP) · English, French, Italian, Spanish
- Events & fluents, collections, deontics... — nearly every idea prototyped at least once

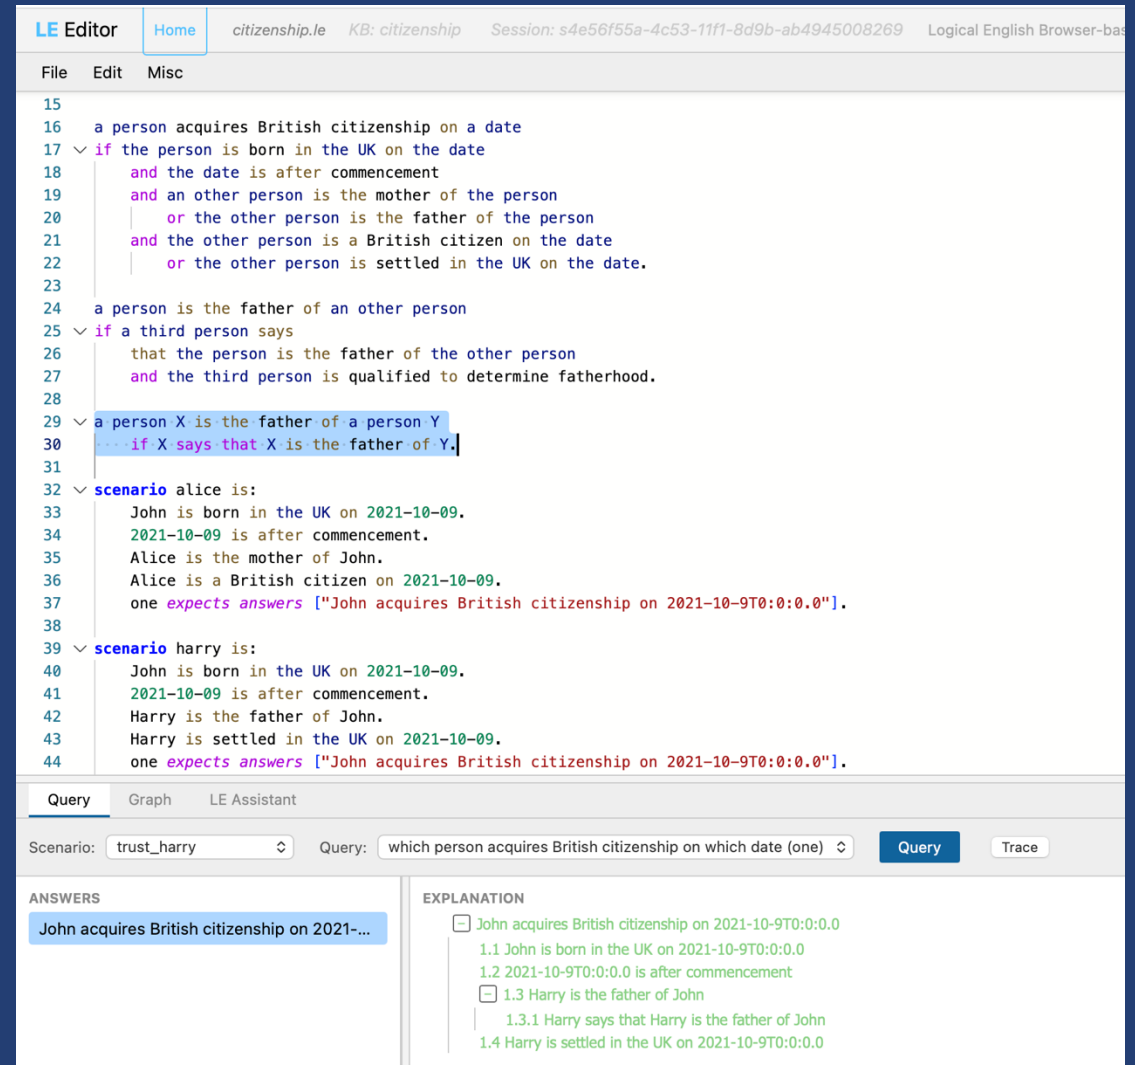

LE2 — a self-contained system (same working group)

- One command or one Docker image: reasoner + browser IDE + web/MCP/DAP APIs
- Single Prolog back-end: meta-interpreter, explanations built in
- Tests and verification are part of the language
- Extension hooks (parse / second pass / reasoning)

Two phases of one project: LE1 explored the design space; LE2 ships its stable core.

A self-contained IDE

- Template-aware editing: your vocabulary drives highlighting, completion, hover
- A verifier at every load: structured diagnostics with suggested fixes
- **Every answer explained — and every failure too**
- Click a proof step → the rule that produced it
- Isolated sessions per document: a classroom on one server
- Graph view · in-editor debugger · MCP for tool-using LLMs

Demo 1 · The British Nationality Act, live

- Read the law — it is the program
- Ask a question; walk the explanation back to the source
- Break the scenario, then repair it from the failure explanation itself
- (what-if by right-click: delete a fact · add it back · assume it)

Abduction

the templates are:

a person exhibits *a symptom*.
a person has *a disease*; assumable.

a person exhibits fever if
the person has measles
and it is not the case that
the person is immune to measles.

- “; assumable” is the entire syntax — unproven goals are assumed, reported as unknowns
- Conditional answers, as this morning:
- “bob exhibits fever, assuming bob has measles”
- Everywhere: amber explanation nodes, Assume checkboxes, assumption cards
- **No integrity constraints: NAF guards over closed facts eliminate candidates**

Logical English 2 — PEG 2026, Lisbon

```
28  ∨ the templates are:
29      *a person* exhibits *a symptom*.
30      *a person* has *a disease*; assumable.
31      *a person* is immune to *a disease*.
32      *a person* is vaccinated against *a disease*.
33
34  ∨ the knowledge base diagnosis includes:
35
36  ∨ a person exhibits fever if
37      the person has flu.
38
39  ∨ a person exhibits fever if
40      the person has measles
41      and it is not the case that the person is immune to measles.
42
43  ∨ a person exhibits rash if
44      the person has measles
45      and it is not the case that the person is immune to measles.
46
47  ∨ a person exhibits rash if
48      the person has food allergy.
49
50  ∨ a person is immune to a disease if
51      the person is vaccinated against the disease.
52
53  > scenario  checkpoint is: ...
72  ∨ scenario  vaccinated is:
73      bob is vaccinated against measles.
```

Query

LE Assistant

scenario: vaccinated

Query: bob exhibits fever and bob exhibits rash (diagnose)

Query

ANSWERS

bob exhibits fever and bob exhibits rash ?

2 unknown goals:

bob has flu
bob has food allergy

EXPLANATION

- ☐ bob exhibits fever
- ☐ bob has flu
- ☐ bob exhibits rash
- ☐ bob has food allergy

Logical
Contracts

The Proof Game – for any program

- This morning's game was propositional — the full game is first-order
- Wiring binds variables; bind one two ways → a visible clash
- Negation as failure: drop a FAIL card — or wire out why every attempt fails
- “for all cases” must be discharged case by case
- Child (unique colors) Mode; propositional

Demo 2 · Playing a proof

- Happy dragons: wire the proof, meet a clash, FAIL a vacuous “for all”
- Child Mode, for ages before text
- Differential diagnosis: rival explanations — until vaccination eliminates one

Since the paper — authoring & LLMs

Authoring without syntax

- Fill-in-the-blank Scenario & Query form editors
- What-if Scenario Variations; patch the scenario
- "Executive mode": read-only, phone-friendly, shareable URL
- Bento boxes

LLM proposes, logic curates

- “Write it in English”: NL → facts/queries through your templates only
- Every proposal verified against the program before insertion; every LE file carries its own tests
- LE Assistant in the IDE
- MCP so agents load, query and verify LE through a typed interface

Using it

- **Public server: le2.logicalcontracts.com**
- Yours: `docker run -p 3050:3050 logicalcontracts/le2` — or one SWI-Prolog command
- github.com/LogicalContracts/LogicalEnglish2
- Tutorial · Proof Game teacher's guide · examples library (incl. R. Kowalski's book subset)
- Paper [appendix](#) (with later updates)
- Tell us about your use: mc@logicalcontracts.com, jd@logicalcontracts.com

Obrigado — questions?

...just one more thing...
